

DTInsight: A Tool for Explicit, Interactive, and Continuous Digital Twin Reporting

Kérian Fiter, Louis Malassigné-Onfroy, Bentley Oakes

Grand Rapids, MI, USA - 2025-10-07

What does your Digital Twin (DT) do?

Our goal: to help practitioners **easily** and **systematically** report their DT's capabilities with the DTInsight tool

Robot arm

A Digital Shadow for Accurate Robot Motion Control: Integrating Data with Friction Models, Heithoff et al.

Concrete mixer

Probabilistic Update Scheduling for Digital Twins: A Semi-Markov Approach, Andersen et al.

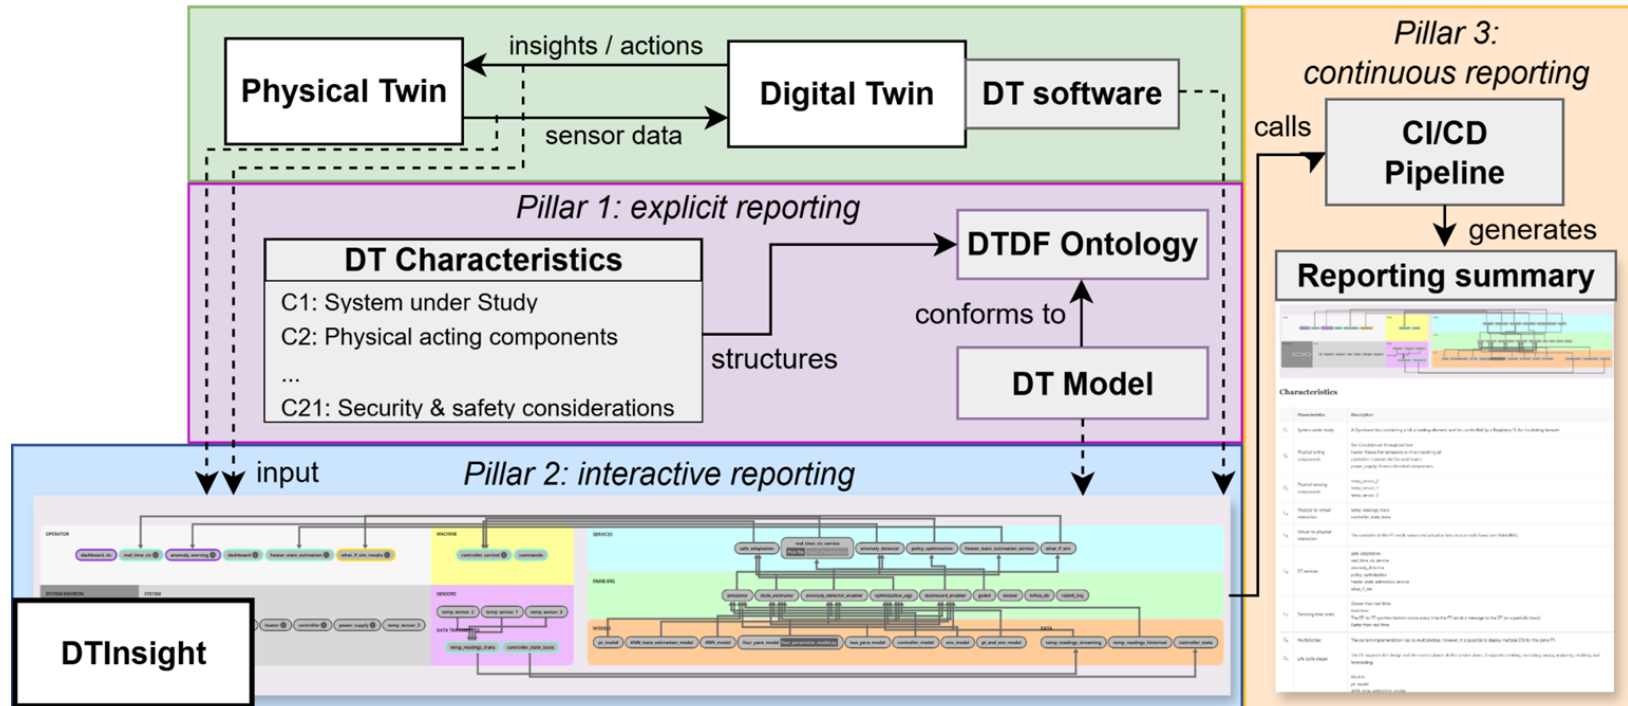

21 DT characteristics from previous work [1]

- C1. System under study
- C2. Physical acting components
- C3. Physical sensing components
- C4. Physical-to-virtual interaction
- C5. Virtual-to-physical interaction
- C6. DT services
- C7. Twinning time-scale
- C8. Multiplicities
- C9. Life-cycle stages
- C10. DT models and data
- C11. Tooling and enablers
- C12. DT constellation
- C13. Twinning process and DT evolution
- C14. Fidelity and validity considerations
- C15. DT technical connection
- C16. DT hosting/deployment
- C17. Insights and decision making
- C18. Horizontal integration
- C19. Data ownership and privacy
- C20. Standardization
- C21. Security and safety considerations

Research Questions

- (1) How to make DT reporting more formal & systematic?
- (2) How to easily explain a DT to different stakeholders?
- (3) How to provide continuous reports of evolving DTs?

(1) Explicit (2) Interactive (3) Continuous

21 characteristics to describe a DT

- C1. System under study
- C2. Physical acting components
- ...
- C21. Security and safety considerations

(1) Explicit representation in Ontology Modeling Language

```
// C10: Models/Data
aspect Input
concept Model < DTComponent, Input
concept Data < DTComponent, Input

relation entity InputTo [
  from Input
  to Enabler
  forward inputTo
  reverse hasInput
]
```

OML vocabulary (concepts)

```
// MODELS / DATA
instance controller_model : DTDFVocab:Model [
  DTDFVocab:inputTo simulator
]
instance sensor_data_historical : DTDFVocab:Data
[
  DTDFVocab:inputTo simulator, data_processing, data_fusion
  DTDFVocab:fromData aeroboast_pt:sensor_data
]

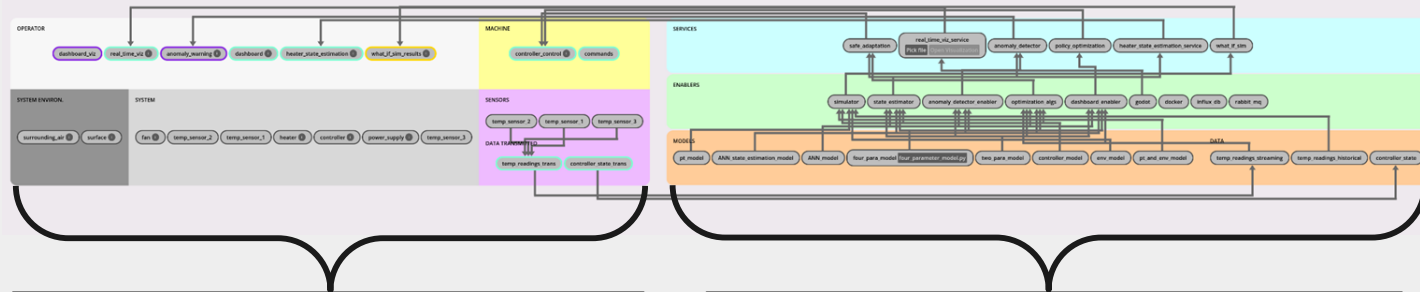

// C16: DT hosting/deployment
instance deployment : DTDFVocab:Deployment [
  base:desc "The Incubator DT is deployed locally on a LAN."
]
```

OML description (instances)

(2) Interactive DT Conceptual Architecture Visualization

DT constellation for reporting both **structure** and **behaviour**

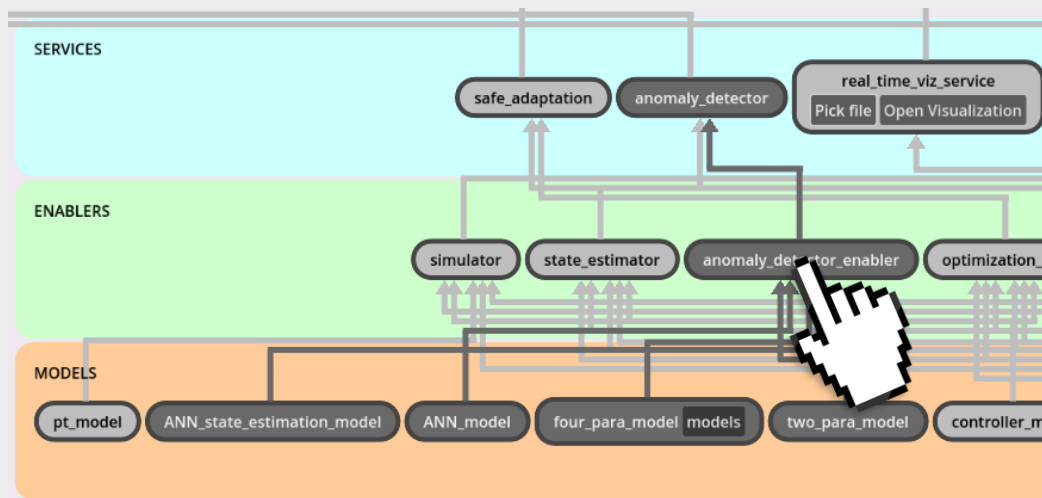

Physical Twin (left part):
Operator, Machine, System
Environment, System, and
Sensors/Data Transmission

Digital Twin (right part):
Models/Data, Enablers, and Services

(2) Interactive DT Conceptual Architecture Visualization

- Viz built in **open-source game engine** (Godot)
- Uses **SPARQL queries** to fetch the DT characteristics
- Example constellation is of the **incubator DT**

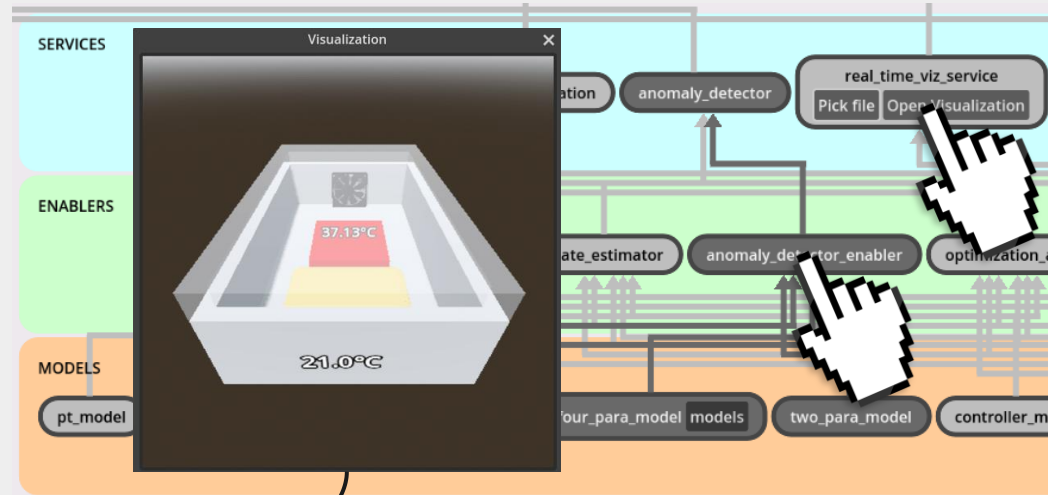

Feng H et al. "The incubator case study for digital twin engineering", arXiv:2102.10390

(2) Interactive DT Conceptual Architecture Visualization

- Three main capabilities:
 - Hover to **explore data flows** between DT components
 - View DT component **scripts**
 - Visualize **real-time sensor data** (graphs or 3D)

Goal: Relating DT structure
and **behaviour**

Interactive monitoring with  RabbitMQ message broker

(3) Continuous Integration into a live reporting page

- **Continually** generated by a CI/CD pipeline to generate a reporting page website
- When the ontology representing the system changes, the **reporting page is re-generated**

(C6) DT services: *safe_adaptation, real_time_viz_service, anomaly_detector, policy_optimization, heater_state_estimation_service, what_if_sim*

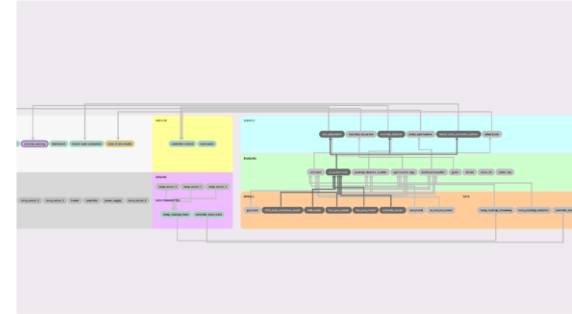

(C20) Standardization: *Communication is carried out using AMQP standard via RabbitMQ. Behavioral models have been produced following the FMI standard version 2.*

GitHub Actions

Digital Twin Reporting Summary

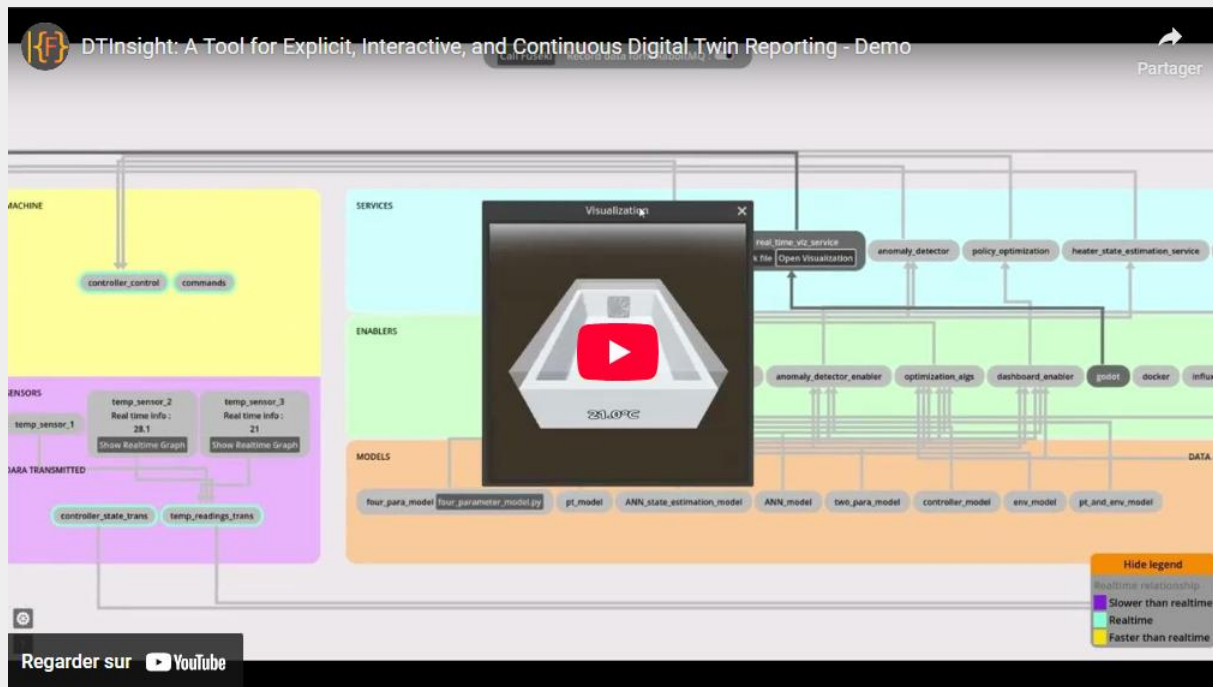

DT Interactive Constellation

DT Characteristics Table

Characteristics	Description
C ₁	System under study A Styrofoam box containing a lid, a heating element, and fan, controlled by a Raspberry Pi, for incubating tempeh.
C ₂	Physical acting components fan: Circulates air throughout box heater: Raises the temperature of surrounding air controller: Controls the fan and heater power_supply: Powers electrical components
C ₃	Physical sensing components temp_sensor_2 temp_sensor_1 temp_sensor_3
C ₄	Physical-to-virtual interaction temp_readings_trans controller_state_trans
C ₅	Virtual-to-physical The controller in the PT sends sensor and actuator data on a periodic basis over RabbitMQ.

Conclusion & Future Work

DTInsight improves stakeholder communication by making DT reporting:

1. **Explicit:** ontology-based modeling
2. **Interactive:** structural + behavioral architecture viz
3. **Continuous:** automated reporting page generation

Paper: <https://arxiv.org/abs/2508.18431>
Tool: <https://github.com/oakeslabmtl/DTInsight>

Future work:

- LLMs for ontology modeling
- Drag-and-drop reporting
- Expose further DT behaviour

DTInsight: A Tool for Explicit, Interactive, and Continuous Digital Twin Reporting,
Fiter, Malassigné-Onfroy, and Oakes

Any questions?
